New BASB120 polypeptides and polynucleotides from Moraxella catarrhalis strain American Type Culture Collection 43617, for use as therapeutic

~

```
The invention learces to the Morakeira catalinaris String invention also relates to immunogenic fragments of the BASB120 protein, expression vectors and host cells comprising BASB120 nucleic acids, the recombinant production of BASB120, vaccine compositions comprising the crecombinant production of BASB120, vaccine compositions comprising the compositions comprising the anti-BASB120 antibody, and a method of identifying a Morakella catarrhalis infection via the detection of BASB120 proteins or antibodies. The vaccine compositions of the invention are sprophylactic or therapeutic agents against Morakella catarrhalis is a Gram negative bacterium frequently isolated from the human upper respiratory tract, which is responsible for several pathological conditions. It is responsible for about 15% of otitis media cases in children (which can lead to temporary or permanent hearing loss). It also causes pneumonia in elderly people, and sinusitis, no concomial infections and, less frequently, invasive diseases. BASB120 proteins or nucleotides may additionally be used in screening for novel and present sequence represents the Morakella catarrhalis strain the present sequence represents the Morakella catarrhalis strain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ;

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL0140-ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              401 ttdwlmyhrkqnpyqvqpthcssttqssldsdasltpslgdfelksacsvdggskfgiga 460

The present invention describes a purified or isolated nucleic acid sequence (I) consisting essentially of one of the 93 nucleotide sequences cy given in AAH81202 to AAH81294, where expression of the nucleic acid in a microorganism is capable of inhibiting proliferation of a microorganism.

(I) have antibacterial and antibiotic activities, and can be used in comparism, and the manufactured antibiotic is useful for cof the microorganism, and the manufactured antibiotic is useful for reducing the activity or level of a gene product required for cof the microorganism in a subject, specifically humans. The reducing that inhibit bacterial growth or proliferation can be used as antisense therapeutics for killing bacteria. In addition to concern required for proliferation can be used as adjactoric tools.

(For example, nucleic acid probes complementary to proliferation required cor proliferation can be used as diagnostic tools.

(For example, nucleic acid probes complementary to proliferation-required cor be used as probes to identify particular species of microorganisms can colinical specimens. AAH81295 to AAH81489 to AAG98431, and AAH81489 to AAH81491.

(For example, in AAG98239 to AAG98431, and AAH81489 to AAH81491.

(For example, in AAG98239 to AAG98431, and AAH81481 to AAH81491.

AAG99078 RESULT

```
AAH84373 to AAH84499 represent Escherichia coli growth and proliferation related DNA sequences (1). AAH84500 to AAH84670 encode the E. coli related DNA sequences (1). AAH84500 to AAH86670 encode the E. coli growth and proliferation related proteins given in AAG99078 and AAG98830 to AAG98999. (1) can be used as potential targets for the generation of new antimicrobial agents, and for identification of compounds which interact with the gene products of (1). In addition the expression of the purification of the proteins, the purified proteins can be used to generate reagents and screen small molecule libraries or other candidate compound libraries for compounds that can be further developed to yield novel antimicrobial compounds. In addition, nucleic acid probes complementary to (I) that are specific for particular species of microorganisms can be used to identify particular microorganism species in clinical specimens, therefore, providing a rapid and dependable method by which to identify the causative agents of a bacterial manner specific microorganisms that produce such proteins translated from mRNA transcribed from proliferation-required sequences can also be used to species-specific microorganisms that produce such proteins in a species-specific manner. AAH84471 and AAH84870 represent sequencing crimmers used in the isolation of E. coli growth and proliferation in the information of the example from the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           11;
                                                                                                                         E. coli growth and proliferation related protein sequence SEQ ID NO:299.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel nucleic acids that inhibit Escherichia coli proliferation, useful for screening for homologous genes and for designing expression vectors
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           68 TWLQMHHATKQEVVRYQAYLQSRLG--NYLPPMSQLLTTARSWQACGHEPYQLPPEHLWG 125

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              (ABB57737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  90 RLGNYLPPMSQLLTTARSWQACGHEPYQLPPEHLWGQIVPTLHLYQDLKSRGILPANTQI 149
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     150 RSVY-----IMVPD 182

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    856 dpaasllg-tlqfetqkirphnakqs---sqtvmdnrltiklvpqlpamnvsft----- 905

capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABLIG176-ABL30511), expressed DNA sequences (ABLIG175) and the encoded proteins (ABB57737-ABB72072).

The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at the wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention significations genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01440-ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  AAZ53015 to AAZ54536, AAZ54577 to AAZ54615, and AAY74253 to AAX75941 represent novel Neisseria meningitis and N. gonorrheae polynucleotides and polypeptides. AAZ54577 to AAZ54576 and AAZ54616 to AAZ5473 represent propertides. AAZ54577 to AAZ5473 represent propertides, in the exemplification of the present invention. The polypeptides, the polynucleotides, antibodies and compositions of the invention can be used as vaccines, as diagnostic reagents, and as immunogenic compositions. The polypeptides can be used in the manufacture of medicaments for treating or preventing infection due to Neisserial bacteria (e.g. meningitis and septicaemia), to detect the presence of Neisseria bacteria, or to raise antibodies. They may also be used to screen for agonists or antagonists, which may themselves have use as antibacterial agents. The polynucleotides of the invention may also be used in gene therapy protocols.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Masignani V, Mora M;

The polypeptides can be used as vaccines against chlamydia trachomatis. Antisenses and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye paratrachoma, and inclusion conjunctivitis; genital diseases such as nongonococcal uretritis, epidymitis, cervicitis, senital diseases such as periheptitus, bartholinitis; penumopathy in breast feeding infants; and venereal lymphogranulomatosis. The polypeptides of the invention may be of use in treating these diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Vaccine; eye disease; conventional trachoma; nonendemic trachoma; paratrachoma; inclusion conjunctivitis; genital disease; perihepatitis; nongonococcal uretritis; epidymitis; cervicitis; salpingitis; bartholinitis; pneumopathy; venereal lymphogranulomatosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

```
The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell.cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  (ABB57737-ABB72072).
The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell
                                                                                                                                                                           83 YQAYLQSRLGNYLPPMSQLL-TTARSWQACGHE-----PYQLPPEHLWGQIVPTLHLYQ 135

cellular signalling and proliferation. The HTFS proteins are useful for screening compounds for their effectiveness as agonists or antagonists of transferase activity, or for compounds that specifically bind to an HTFS protein or which modulates the activity of an HTFS protein.

CC protein or which modulates the activity of an HTFS protein. HTFS protein are useful for treating a disease or condition associated protein are useful for treating a disease or condition associated with decreased or increased expression of functional HTFS pisorders controlled any betterated using such compositions include all proliferative disorders and immune disorders. For example, diseases which may be treated include atherosclerosis, hepatitis, psoriasis, cancers (including treated include atherosclerosis, hepatitis, psoriasis, cancers (including contents) allergies, asthma, anaemia, cirrhosis, concers (including disease, atopic dermatitis, diabetes mellitus, multiple sclerosis, chemmatodia arthritis, pancreatitis, systemic lupus erythematosus, chemmatodia arthritis, pancreatitis, station lupus erythematosus, chemmatodia, and ulcerative collitis. They may also be used to treat complications of cancer, haemodialysis, extracorporeal circulation, contains and haematopoietic cancer, including lymphoma, leukaemia and mystemials to model man diseases, for diagnostic purposes and transgents and man and haematopoietic sancer, including lymphoma, leukaemia and mystemials to model man diseases, contains are useful for creating transgents and man and man and man diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    7;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            to generate hybridisation probes useful in mapping the naturally occurring genomic sequences. HTFS, and its catalytic or immunogenic fragments are useful for screening libraries of compounds in a variety drug screening techniques. Antibodies which specifically bind HTFS may used for the diagnosis of disorders associated with the expression of HTFS, or in assays to monitor patients being treated with HTFS or agonists, antagonists or inhibitors of HTFS. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   82 RYQAYLQSRLGNYLPPMSQLLTTARSWQACGHEPYQLPPEHLWGQIVPTLHLYQDLKSRG 141

rine invention relates to isolated polymuciaculus (1) and completed (II) sequences. ([]) is useful as hybridisation probes, co polymerase chain reaction (PR) primers, oligomers, and for chromosome polymerase chain reaction (PR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The and gene mapping, and in recombinant production of (II). The collectivity of (II) is useful in gene therapy techniques for identifying expressed genes. (I) is useful in gene therapy techniques (II) useful for generating antibodies against it, detecting or (II). (II) is useful for generating antibodies against it, detecting or guantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical (II) and its binding partners are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in capponsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences of the invention.

Companion acid sequences of the invention.

Companion acid sequences of the invention of mutations and ocid sequences of the invention.

Companion acid sequences of the invention.

Companion acid sequences of the invention ocid sequences of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Neisseria meningitidis; Neisseria gonorrheae; antigen; vaccine; antigenic; diagnosis; immunogenic; infection; meningitis; septicaemia; antibacterial; gene therapy.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AA253015 to AA254536, AA254577 to AA254615, and AAY74253 to AAX75941 represent novel Neisseria meningitis and N. gonorrheae polynuclectides and polypeptides. AA25457 to AA254576 and AA254616 to AA255473 represent polypeptides. AA254573 to AA254576 and AA254616 to AA255473 represent polypeptides, the polynuclectides, antibodies and composition. The polypeptides and compositions of immunogenic compositions. The polypeptides can be used in the manufacture of medicaments for treating or preventing infection due to Neisserial bacteria (e.g. meningitis and septicaemia), to detect the presence of Neisseria bacteria, or to ratse antibodies. They may also be used to screen for agonists or antagonists, which may themselves have use as antibacterial agents. The polynuclectides of the invention may also be used in gene therapy protocols.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 10;

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Unpublished observations (NOV-2000).

"Inpublished observations (NOV-2000).

-!- EUNCTION: INVOLVED IN TRANSPORT OF PHOSPHOLIPIDS (BY SIMILARITY).

-!- CATALYTIC ACTIVITY: ATP + H(2) - ADP + PHOSPHATE.

-!- SUBCELLULAR LOCATION: Integral membrane protein.

-!- SIMILARITY: BELOWGS TO THE CATION TRANSPORT ATPASES FAMILY

(E1-E2 ATPASES). SUBFMAILY IV.

-!- CAUTION: REF.1 SEQUENCE DIFFERS FROM THAT SHOWN DUE TO WRONG PREDICTIONS OF EXONS AND BOTH TERMINI FROM THE GENOMIC SEQUENCE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    PROSITE; PS00154; ATPASE_E1_E2; 1.

Inoue A., Takahashi K., Kimura M., Watanabe T., Morisawa S.;
"Molecular cloning of a RNA binding protein, S1-1.";
Nucleic Acids Res. 24.2990-2997(1995).
-!- FUNCTION: NOT KNOWN. BINDS TO RNA HOMOPOLYMERS, WITH A PREFERENCE
FOR POLY(G) AND POLY(U) AND LITTLE FOR POLY(A).
-!- SIMCLACITY: CONTAINS 1 & PAATH DOMAIN.
-!- SIMLIARITY: CONTAINS 1 RANBP2-TYPE ZINC FINGER.
-!- SIMLIARITY: CONTAINS 2 RNA RECOGNITION MOTIFS (RRM).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   44 EPITLNEVADIYVPLAELLHVHATAYQRLQQQK-RGFFHHGRNRSPFIIGLAGSVAVGKS 102

WPI; 2001-159872/16. N-PSDB; AAF59797 New BASB120 polypeptides and polynucleotides from Moraxella catarrhalis strain American Type Culture Collection 43617, for use as therapeutic agents or vaccines against bacterial infections, e.g. otitis media or pneumonia

Claim 4; Page 64; 75pp; English.

ANSB120 protein (AAB60645) and to DRA encoding it (AAF59797), The invention also relates to immunogenic fragments of the BASB120 protein, expression vectors and host cells comprising BASB120 nucleic acids, the recombinant production of BASB120, vaccine compositions comprising the enti-BASB120 antibody, and a method of BASB120, therapeutic compositions comprising the anti-BASB120 antibody, and a method of Compositions comprising the anti-BASB120 antibody, and a method of BASB120 protein or nucleic acid, an antibody against BASB120, therapeutic compositions comprising the anti-BASB120 antibody, and a method of BASB120 proteins or antibodies. The vaccine compositions of the invention are useful as prophylactic or therapeutic agents against Moraxella catarhalis infections in mammals, particularly humans. Moraxella catarhalis is a Gram negative bacterium frequently isolated from the human upper respiratory tract, which is responsible for several pathological conditions. It is responsible for about 15% of otitis media cases in children (which can lead to temporary or permanent hearing loss). It also causes pneumonia in elderly people, and sinualis; on 1050comial infections and less frequently, invasive dispasses Recommended. nosocomial infections and less frequently, invasive diseases. BASB120 proteins or nucleotides may additionally be used in screening for novel antibacterial compounds, and in the diagnosis and staying of infections. The present sequence represents the Moraxella catarrhalis strain ATCC43617 BASB120 protein. The invention relates to the Moraxella catarrhalis strain ATCC43617
